ELECTRICAL CHARACTERIZATION OF DIFFERENT CARBON BASED POLYMER COMPOSITES

Mauro Giorcelli, Aamer Abbas Khan,
Patrizia Savi, Franco Berruti, Alberto Tagliaferro

Biorefinery I: Chemicals and Materials from Thermo-Chemical Biomass Conversion and Related Processes

Outline

- ▶ Motivation and Application
- ▶ Biochar as Carbon Filler
- ▶ Composite preparation
- ▶ Microwave characterization
- ▶ Results
- ▶ Comment and comparasion with CNTs
- ▶ Conclusions

Motivation and Application

Motivation and Application

Electrical &
electronics

Energy
& power

Automotive

Aerospace

Biochar as Carbon filler by i[🔥]cfar

- ▶ Chemical decomposition of organic materials in the absence of oxygen

- ▶ Products:

- Gases (non-condensable vapors)
- Liquids (condensable vapors: bio-oil)
- Solids (bio-char and ash)

Biochar as Carbon Filler

► Advantage:

Low price

Recycled material

New opportunities

Composite preparation

- Pulverize by blade mixer

Composite preparation

► Fesem characterization (Zeiss supra 40)

As it is

Powder

Composite preparation

A crucial point to obtain good dispersion

Mixing procedure

(Recently acquired)

Ultra turrax mixer

Three roll mills mixer

Low quantity material is enough

Needs Not less 50 ml of material

Composite preparation

Comparison between different dispersion technique in case of Carbon Nanotubes (CNTs)

1 wt.% of MWCNT 6 (diameters: 18-35 nm; Length: >10 μm) in Epoxy resin

ULTRATURRAX

200 μm

WD = 8 mm
Mag = 206 X

Aperture Size = 30.00 μm
EHT = 5.00 kV

Signal A = InLens
Stage at T = 45.0 °

Date :25 Feb 2015 Time :15:04:35
SALVATORE

THREE ROLLS MILLING

200 μm

WD = 7 mm
Mag = 100 X

Aperture Size = 30.00 μm
EHT = 5.00 kV

Signal A = InLens
Stage at T = 45.0 °

Date :18 Feb 2015 Time :10:02:09
SALVATORE

Composite preparation

Microwave characterization

Permittivity measurements

The most common way to describe a system response to an electro- magnetic wave is through its dielectric constant (also called permittivity)

Permittivity is a complex quantity. Its **real part** describes the **ability to store energy** while its **imaginary part** describes the **ability to dissipate energy**

$$\varepsilon = \varepsilon(f)$$

As **electrical conductivity** is related to energy dissipation a close correlation exists

$$\varepsilon'' = \frac{\sigma}{2 \pi f \varepsilon_0}$$

Microwave characterizations

A Network Analyzer (E8361A) + A commercial dielectric probe (Agilent 85070D)

Advantages:

- ☺ Frequency band 200 MHz - 20 GHz
- ☺ Fast response
- ☺ Samples of small dimensions

Drawback:

- ☹ Roughness and flatness of the surface are critical
- ☹ Thick samples

$\varnothing = 2.2 \text{ cm}$

Sample thickness > 1.5 cm

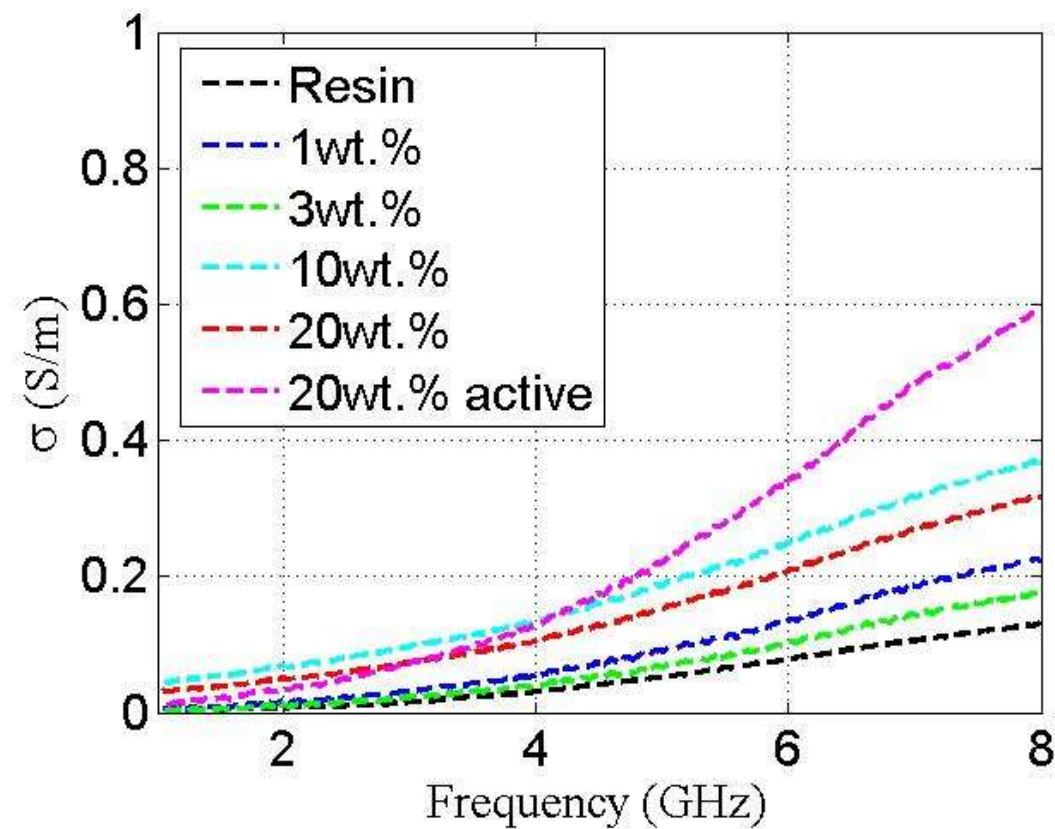

Results

- ▶ Standard Biochar
- ▶ Activated Biochar (high surface area)
- ▶ Comparison with CNTs

Results (real part)

Results (Conductivity, imaginary part)

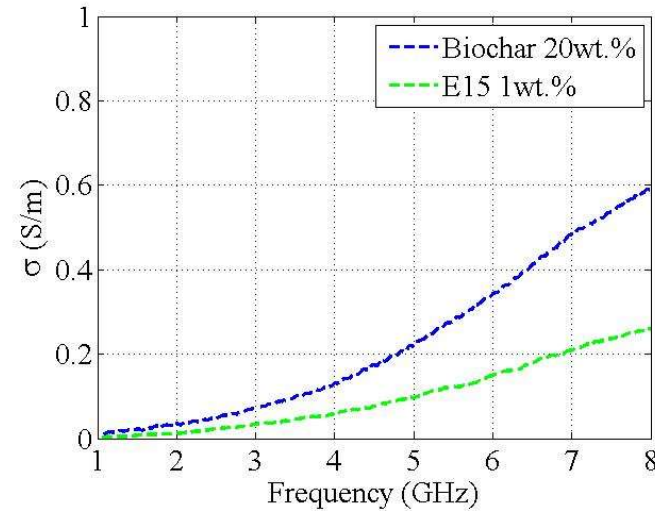

$$\varepsilon'' = \frac{\sigma}{2 \pi f \varepsilon_0}$$

Results (comparison with CNTs)

Real part

Conductivity

Conclusions

- ▶ Low quantities of Biochar fillers have not effect on permittivity as CNTs
- ▶ To obtain effect on permittivity we need to be more than 10 wt.%
- ▶ Activated Biochar (high surface area) have more effect respect to no activated Biochar
- ▶ In order to have compared values with CNTs we need to arrive around 20 wt.%
- ▶ Further investigation are need in particular to test mechanical properties.

Thank you for your attention
